(54) Title: **SYSTEM AND METHOD FOR PROCESSING APPLICATIONS FOR FINANCIAL SERVICES**

WO 01/61598 A1

(57) Abstract: A system and method for processing financial service applications include a flexible interface (208) to a variety of sources for application data, and uses an automated method for generating graphical user interfaces (208) in the preferred embodiment. The system processor (210) can operate in either batch or real time mode to accommodate a variety of data sources and to level system loading. The system also includes a second flexible interface (208) to a variety of decision engines (200, 202, 204, 206). The method supports use of a single decision engine (200, 202, 204, 206), but also accommodates the use of two or more decision engines in parallel or in series to process data from the same application. Interfaces (208) to the decision engines and customer input ports may be custom generated. An automated method for generating Graphical User Interfaces (GUIs) is illustrated in the context of a system for processing financial applications. In one embodiment, the GUI generator converts domain data representing over one thousand application types into an equal number of corresponding user screens. The interface may also be bi-directional, operating on user inputs to validate data or check for double keying.

**SYSTEM AND METHOD FOR PROCESSING APPLICATIONS
FOR FINANCIAL SERVICES**

FIELD OF THE INVENTION

5 The invention relates generally to the processing of financial data, and more particularly to a system and method for processing applications for financial services such as consumer credit card accounts, home mortgage loans, or other services. One embodiment of the invention incorporates the automated generation of graphical user interfaces (GUI's).

10 **BACKGROUND OF THE INVENTION**

 Present-day consumers have come to rely on the convenience of credit cards and other financial services. There is a high volume of new account applications for such services, even in the credit card industry, for example, where there is already a large base
15 of existing credit card holders. Several factors may account for the high volume of credit card applications: consumers who have recently reached the age of majority are applying for their first credit card; existing credit card users often change from one credit service provider to another in order to obtain more favorable terms; and some credit card holders desire additional or upgraded credit cards.

20 The financial services industry is competitive. Banks and other financial service providers therefore may review a large number of applications in a limited amount of time, and they must make good decisions regarding the credit-worthiness of potential borrowers. Automated systems have been developed to process applications quickly and to track individual credit applications through the review process. Many application
25 processing systems manage risk by employing a decision engine to consistently apply best business practices associated with the selection of customers.

 Known systems and methods for processing high volumes of credit applications receive data from a single input channel, operate either in batch mode or in real-time mode, make credit decisions using a single decision engine, and customize user
30 interfaces for different application types. Drawbacks of such implementations are considered below.

Credit applications typically include information such as name and address of the applicant(s), and may include information such as employment history, monthly income, monthly financial obligations, and the amount of credit being applied for. Potential customers submit credit applications to banks or other financial institutions through various channels. A drawback of existing application processing systems is that they are typically configured to accept applications from a single channel, for example paper applications received in the mail, applications submitted via the Internet, or applications received over the phone. Moreover, application processing systems may operate in a mode that is tailored to the type of input channel. For example, systems that process paper applications typically process in batch mode, whereas an interactive Internet application requires real time processing. It is inefficient for financial institutions to implement and maintain separate systems for processing applications that are submitted through different channels. On the other hand, it is a convenience to applicants, and thus a benefit to financial service providers, to offer a variety of application input alternatives.

Credit decisions are often made on the basis of information from the credit application itself, and from historical credit information provided by one or more independent credit bureaus. Decision engines typically include software implementations of algorithms designed to quantify risk based on such information, resulting in a determination as to whether credit should be offered to a particular applicant, and, if so, under what terms. Such algorithms are constantly evolving. As a consequence, application processing systems tailored to a particular decision engine may quickly become obsolete.

Additionally, many data processing systems, including those that process applications for financial services, are required to accommodate a variety of different user interface screens. A financial service provider may, for example, have hundreds of different new account application formats related to the variety of services it offers to consumers. System developers respond to this need by coding or scripting a variety of user interfaces that are tailored to the requirements of each application. Unfortunately, user interface requirements may be dynamic for many data processing operations. A financial services provider, for example, may wish to offer new services, may require new information to process existing products, or may simply change the layout of a user

interface to make it more user-friendly. The result can be a high level of maintenance in the form of software support, which may be both costly and time-consuming.

Thus, existing application processing systems may have narrow operational value, and may require frequent modification. These and other drawbacks limit the efficiency of such systems.

SUMMARY OF THE INVENTION

The invention overcoming these and other drawbacks in the art relates a system and method that may accept applications for financial services from a variety of input channels, may operate in various processing modes, may utilize one or more decision engines during operation, and may generate user interface script automatically.

It is an object of the invention to make the process of applying for financial services more convenient for consumers. The techniques described herein for enabling a variety of input channels and for processing applications in a variety of modes may provide more data input options for applicants and may be a more efficient use of computing resources for financial institutions.

It is another object of the invention to provide financial institutions with a more powerful technique for automating credit decisions. A flexible interface to decision engines may be advantageous for several reasons. First, this type of interface may make multiple types of decision engines available simultaneously. This would be a benefit, for example, where different engines are used together to make decisions on different financial products, or where two or more decision engines are used to make a single determination. Moreover, a flexible interface may significantly reduce the cost of replacing decision engines in the overall system, when and if it becomes necessary.

It is another object of the invention to eliminate or reduce the amount of manual scripting required to support new user interfaces to data processing systems. By automatically generating user interface script based on functional parameters, it is no longer necessary to manually develop screen interfaces for the variety of applications that may be supported by any one system. This technique may be executed *in situ* (i.e., in the process of each user transaction), or it may be executed only once after a new application has been defined (in which case the resulting user interface script would be stored for later use).

In one embodiment of the invention, an applicant may communicate with the data processing system via the Internet. The applicant may further select a particular financial service from a menu of choices. In response, the script generator creates an appropriate user interface, which is presented to the user for completing and submitting an application for the selected financial service. The system processes the application data in a mode that is tailored to the input channel; here, it is likely that the system will operate in real time mode. The system may then select and employ one or more decision engines, as appropriate for the type of application that is to be processed. Once a determination has been made whether to perform financial services for the applicant, the data processing system notifies the applicant that their application has been either accepted or rejected.

The following drawings and descriptions further describe the invention, including several different embodiments of the major system components and processes. The construction of such a system, implementation of such a process, and advantages will be clear to a person skilled in the art of data processing generally, including financial services.

BRIEF DESCRIPTION OF THE DRAWINGS

Figure 1 is the schematic diagram of a system that processes applications for financial services, according to one embodiment of the invention.

Figure 2 is a flow diagram illustrating the logical relationship between functional components of a system that processes applications for financial services, according to one embodiment of the invention.

Figure 3 is a flow diagram illustrating a method for processing applications related to financial services, according to one embodiment of the invention.

Figure 4 is a flow diagram illustrating the inputs and outputs of an automated Graphical User Interface (GUI) generator, which has been adapted for mediating communication between an application processing system and an applicant.

Figure 5 is a flow diagram illustrating a method for mediating communication between a system and a user, according to one embodiment of the invention.

Figure 6 is the schematic of a user screen resulting from operation of an automated Graphical User Interface (GUI) generator, according to one embodiment of the invention.

5

DETAILED DESCRIPTION OF THE INVENTION

Figure 1 illustrates a system architecture for processing applications related to financial services according to the invention. A purpose of the system is to connect sources of electronic application data to decision engines and credit bureaus, and to host
10 programs that coordinate the processing of application data. The schematic depicts among other possible resources: servers 114, 116, 118, 120, 122, 126 and 130; clients 104, 108, and 110; and databases 124, 128, 132 and 134. Servers and clients are connected via communication link 112, according to one embodiment of the invention.

Server 114 may perform or coordinate the processing of financial applications
15 including functions such as data collection, validation, tracking, reconciliation, repair, routing, fulfillment, and reporting functions. Servers 116, 118, and 120 represent a variety of decision engines that such a system may include or interface to. Servers 122, 126 and 130 illustrate various credit bureau servers that the system may utilize to obtain credit history for a given applicant. Servers 114, 116, 118, 120, 122, 126 and 130 may be
20 or include, for instance, a workstation running the Microsoft WindowsTM NTTM, WindowsTM 2000, Unix, Linux, Xenix, IBM AIX, Hewlett-Packard UX, Novell NetwareTM, Sun Microsystems SolarisTM, OS/2TM, BeOSTM, Mach, Apache, OpenStepTM or other operating system or platform.

Clients 104, 108, and 110 represent various sources for applications related to
25 financial services. All provide applications to the processing system in electronic format. Client 104 depicts a source of electronic applications where paper documents 100 have been converted into electronic format by a scanner 102. Client 108 depicts a source for electronic applications originating via telephonic input 106. Client 110 depicts a direct user interface. Clients 104, 108, and 110 may be or include, for instance, a personal
30 computer running the Microsoft WindowsTM 95, 98, MilleniumTM, NTTM, or 2000, WindowsTMCETM, PalmOSTM, Unix, Linux, SolarisTM, OS/2TM, BeOSTM, MacOSTM or

other operating system or platform. Clients 104, 108, and 110 may include a microprocessor such as an Intel x86-based device, a Motorola 68K or PowerPC™ device, a MIPS, Hewlett-Packard Precision™, or Digital Equipment Corp. Alpha™ RISC processor, a microcontroller or other general or special purpose device operating under programmed control. Clients 104, 108, and 110 may furthermore include electronic memory such as RAM (random access memory) or EPROM (electronically programmable read only memory), storage such as a hard drive, CDROM or rewritable CDROM or other magnetic, optical or other media, and other associated components connected over an electronic bus, as will be appreciated by persons skilled in the art. Clients 104, 108, and 110 may also be or include a network-enabled appliance such as a WebTV™ unit, radio-enabled Palm™ Pilot or similar unit, a set-top box, a networkable game-playing console such as Sony Playstation™ or Sega Dreamcast™, a browser-equipped cellular telephone, or other TCP/IP client or other device.

Databases 124, 128 and 132 may include credit history data for applicants and non-applicants, as maintained by various credit bureaus. Database 134 may include application data, application status information, and programs used by the application processing system 114. Databases 124, 128, 132 and 134 may be, include or interface to, for example, the Oracle™ relational database sold commercially by Oracle Corp. Other databases, such as Informix™, DB2 (Database 2) or other data storage or query formats or platforms such as OLAP (On Line Analytical Processing), SQL (Standard Query Language), Microsoft Access™ or others may also be used, incorporated or accessed in the invention.

Communication link 112 connects servers 114, 116, 118, 120, 122, 126 and 130 to each other and to clients 104, 108, and 110. Communications link 112 may be, include or interface to any one or more of, for instance, the Internet, an intranet, a PAN (Personal Area Network), a LAN (Local Area Network), a WAN (Wide Area Network) or a MAN (Metropolitan Area Network), a frame relay connection, an Advanced Intelligent Network (AIN) connection, a synchronous optical network (SONET) connection, a digital T1, T3, E1 or E3 line, Digital Data Service (DDS) connection, DSL (Digital Subscriber Line) connection, an Ethernet connection, an ISDN (Integrated Services Digital Network) line, a dial-up port such as a V.90, V.34 or V.34bis analog

modem connection, a cable modem, an ATM (Asynchronous Transfer Mode) connection, or FDDI (Fiber Distributed Data Interface) or CDDI (Copper Distributed Data Interface) connections. Communications link 112 may furthermore be, include or interface to any one or more of a WAP (Wireless Application Protocol) link, a GPRS (General Packet Radio Service) link, a GSM (Global System for Mobile Communication) link, a CDMA (Code Division Multiple Access) or TDMA (Time Division Multiple Access) link such as a cellular phone channel, a GPS (Global Positioning System) link, CDPD (cellular digital packet data), a RIM (Research in Motion, Limited) duplex paging type device, a Bluetooth radio link, or an IEEE 802.11-based radio frequency link. Communications link 112 may yet further be, include or interface to any one or more of an RS-232 serial connection, an IEEE-1394 (Firewire) connection, a Fibre Channel connection, an IrDA (infrared) port, a SCSI (Small Computer Serial Interface) connection, a USB (Universal Serial Bus) connection or other wired or wireless, digital or analog interface or connection.

Servers 114, 116, 118, 120, 122, 126, 130 and clients 104, 108, and 110 may utilize networked enabled code related to communication link 112. Network enabled code may be, include or interface to, for example, Hyper text Markup Language (HTML), Dynamic HTML, Extensible Markup Language (XML), Extensible Stylesheet Language (XSL), Document Style Semantics and Specification Language (DSSSL), Cascading Style Sheets (CSS), Synchronized Multimedia Integration Language (SMIL), Java™, Jini™, C, C++, Perl, UNIX Shell, Visual Basic or Visual Basic Script, Virtual Reality Markup Language (VRML) or other compilers, assemblers, interpreters or other computer languages or platforms.

Figure 2 is a flow diagram illustrating the logical relationship between functional components of a system that processes applications for financial services according to one embodiment of the invention. One purpose of the processes depicted in Figure 2 is to make a decision, for each application, whether an offer should be made to an applicant for financial services such as a credit card account or a mortgage. The processes may also be used to establish terms of such an offer, for instance the maximum amount of money to be loaned, or the minimum interest rate to be charged.

Many of the functional elements in Figure 2 can be related to components of the

system architecture depicted in Figure 1. For example, scanned applications 200 may reside on client 104; telephonic applications 202 may reside on client 108; and online applications 204 may be provided by client 110. Additionally, the functional elements in Figure 2 identified as the input interface 208, processor 210, and decision router 214 may be executed on server 114. Memory 212 may correspond to database 130. Decision engines 216, 218, and 220 may be embodied in servers 116, 118, and 120. Credit bureaus 224, 226, and 228 may operate through servers 122, 126 and 130. Data source 206, decision engine 222, and credit bureau 230 are shown to indicate the expandability of the application processing method. The interface to fulfillment process 232 illustrates that a positive result from processing an application may be, for example, a downstream process that issues a credit card or provides some other consideration to the applicant. In another embodiment, fulfillment process 232 may interface more directly to decision engine 216, 218, 220, or 222.

Advantageously, input interface 208 is adapted to receive electronic application data from a variety of input sources and types, depicted in Figure 2 as 200, 202, 204, and 206.

Processor 210 may perform or coordinate functions such as data collection, validation, tracking, repair, routing, fulfillment, and reporting. Data collection relates to application data received through interface 208. Validation may involve checking the application data received against a pre-defined set of criteria in order to identify data input or translation errors originating, for example, at sources 200, 202, 204, or 206. The repair function may be able to fix at least some of the errors types that are detected by the validation function. The routing function relates, for instance, to coordination of the decision router 214 described in more detail below. Processor 210 also may interfaces to or coordinate the passing of data to fulfillment process 232, for example in the case where a credit account is to be established or where a credit card is to be physically mailed to the customer of a bank or other financial institution.

Processor 210 may operate on the application data in either batch or real time mode. Batch mode may operate on a group of applications only at off-peak hours. Alternatively, batch mode may operate both during peak and off-peak hours to achieve workload leveling (in effect reducing or eliminating peak loads). Real time mode is

required for interactive processing sessions, for example where an applicant is making application online and where a response is made to that applicant regarding an offer of financial services within seconds or minutes. Together, the flexible input interface 208 and selectable modes of processor 210 maximize the efficiency of server 114 and decision engines 216, 218, 220, and 222, and eliminate the need for dedicated application processing systems for different application data sources or types.

Decision router 214 performs at least three functions. First, it controls the routing of application data to decision engine(s) 216, 218, 220, and/or 222. Decision router 214 may select a single decision engine, for example where decision engines 216, 218, 220, and 222 are each tailored for different financial services and where the applicant has only applied for a single financial service. Decision router 214 may select two or more decision engines to process the application data simultaneously, for instance where the applicant has applied for more than one type of financial service. Such parallel processing may also be appropriate where the results of two or more decision engines are used to make a determination as to an offer for a single financial service. Decision router 214 may also select two or more decision engines to process the application data in serial fashion. This may be advantageous, for example, where the single financial service applied for was denied, but where the financial institution wishes to consider other financial services that it might offer to the applicant. Additionally, two or more decision engines may be selected for serial operation where the results of one decision engine can be used in subsequent calculations by another decision engine. Better decisions regarding offers for financial services may result from the ability to select and employ one or more decision engines during application processing.

A second function of decision router 214 is to provide formatting of the application data as required by each type of decision engine. In general, different developers may have coded decision engines 216, 218, 220, and 222, and they may have done so at different times. It is therefore unlikely that the required formats for the application data that they process are consistent. Decision router 214 may therefore utilize a library of decision engine proxies to format application data received from input sources 200, 202, 204, or 206 into the appropriate format for decision engines 216, 218, 220, and/or 222. The flexibility of this interface allows those who maintain the

application processing system to readily connect to new or different decision engines. This may result in substantial time and cost savings.

A third function performed by decision router 214 is to receive the decisions reached by decision engines 216, 218, 220, and/or 222 and route them to other decision engines or to processor 210, as appropriate.

Figure 2 also illustrates that decision engines 216, 218, 220, and 222 may each obtain historical credit information from one or more credit bureaus 224, 226, 228 and 230 that is considered together with application data from input sources 200, 202, 204, and 206 in making credit or other decisions. The decision engines, 216, 218, 220 and 222 may include, for example, the commercial Magnum™, ACAPST™, FirstClass™ or other engine or service.

Figure 3 is a flow diagram illustrating a method for processing applications related to financial services according to one embodiment of the invention. The diagram demonstrates that after an appropriate start 300, typically the receipt of application data, the processor must determine the input channel 302 from which the data came. If the data originated with a scanned paper application 304 or other non-interactive session 324, then batch mode is selected 310. Batch mode may function by placing data in a queue 312 until the queue becomes full 314 or until the processor determines that the decision engines have sufficient processing capacity (as with the load leveling technique described above). Thereafter, one or more decision engines are selected 316, and all applications in the batch are sent 318 to the decision engine(s). After decisions are received 320, positive results are sent to the fulfillment process 322.

Figure 3 also illustrates that data from telephonic applications 306 or Internet applications 308 that are part of an interactive session 324 are selected 326 for real time processing. In real time mode, one or more decision engines must also be selected 328 before applicant data is sent 330 to the decision engines. In contrast to the batch mode, however, once results are returned 332, notification is made to the applicant in real time 334 before initiating the interface to the fulfillment process 322.

The dual mode capability illustrated by Figure 3 provides an advantage for financial entities: separate systems for batch and real time processing of financial applications are not required. This may result in lower operating and support costs.

In an another embodiment of the process shown in Figure 3, both alternatives operate in real time mode. In this instance, the only difference between alternative flows may be that one processing path provides for real-time feedback (process-and-notify) whereas the other does not (process).

5 Figure 4 is a flow diagram illustrating the inputs and outputs of an automated Graphical User Interface (GUI) generator 500, which has been adapted for mediating communication between an application processing system and an applicant. The initial input is represented by domain data 400. Domain data 400 may include, for example, the name of an applicant and the location on the application that the name is to be found.
10 Domain data 400 may similarly include the description and location of the applicant's address, present employer, or other information. Domain data 400 may be generated manually, for example by key entry, or it may be automated, as in the case of document scanning and character recognition. Generation of domain data 400 may further involve automatic conversion from a flat file format to XML format. The output of GUI
15 generator 500 may be a User screen 600 that has been tailored for collecting and displaying information relevant to one or more financial services. There may be hundreds or even thousands of different embodiments of user screen 600. Automated generation of the user interface eliminates the time and expense that would otherwise be associated with manual code generation.

20 User screen 600 may further have a spatial correspondence to the variety of paper applications that it relates to. This may be an advantage, for example, where an agent of the financial entity processing the application is comparing the electronic version of application data to an original paper copy of the application. Where a user adds data to user screen 600, data from that screen may then become another input to GUI Generator.

25 Figure 5 is a flow diagram illustrating a method for mediating communication between a system and a user, according to one embodiment of the invention. All processes shown may be implemented via application software included in input interface 208, and may reside on server 114. In the instance where GUI generator 500 is to display a user screen 600 based on domain data 400, the GUI mediator 502 calls
30 HTML factory 508 and utilizes XSL transformation 510 to convert XML formatted domain data 400 into an HTML user screen 600. In the instance where GUI generator

500 is to receive data that is input on user screen 600, GUI mediator 502 may validate the input data using GUI validator 504 and/or GUI double key checking 506.

GUI validator 504 may use a rules engine to perform a validation on the data entered by the user in step 600. Such rules may be encoded in a database using Java-like syntax, and may be loaded on instantiation of the service. GUI validator 504 may be implemented according to the JavaCC rules engine.

The GUI double key checking process 506 may be responsible for scanning the XML document to determine, for example, which fields need to be double keyed. In one embodiment, all double keyed fields may be cleared of text and returned to the user for re-keying. The original values may be stored in the document. If the re-key and the original input match, the document may be forwarded.

Figure 6 is the schematic of a user screen resulting from operation of an automated Graphical User Interface (GUI) generator, according to one embodiment of the invention. The notional schematic illustrates that a user screen 600 may include a tool bar 602, drop down menu, or similar technique for selecting user functions. User screen 600 may also include data fields for collecting or correcting applicant data 604, or for defining, selecting, or viewing information about financial services that may be offered to the applicant 606.

The specification and examples provided above should be considered exemplary only. It is contemplated that the appended claims will cover any other such embodiments or modifications as fall within the true scope of the invention.

What is claimed is:

1. A system for processing applications for financial services, comprising:
an interface to at least one source of application data;
a processor;
5 a decision router; and
an interface to at least two decision engines.
2. The system of claim 1, wherein the application data comprises information for at least one credit account application, mortgage account application, bank account application, or other financial service.
- 10 3. The system of claim 1, wherein the sources of application data comprise data from paper applications that have been converted to electronic format.
4. The system of claim 1, wherein the sources of application data comprise telephonic applications that are the result of an automated process.
5. The system of claim 1, wherein the sources of application data comprise telephonic applications that are the result of an interaction with an operator.
- 15 6. The system of claim 1, wherein the sources of application data comprise online sessions with applicants.
7. The system of claim 1, wherein the sources of application data comprise online sessions with agents of an entity offering financial services.
- 20 8. The system of claim 1, wherein the processor is at least temporarily configured to operate in batch mode.
9. The system of claim 1, wherein the processor is at least temporarily configured to operate in real time mode.
10. The system of claim 1, wherein the decision engines are adapted to make decisions
25 on the same type of financial service.
11. The system of claim 1, wherein the decision engines are adapted to make decisions on different types of financial services.
12. The system of claim 1, wherein the system comprises at least one interface for providing a result to an applicant.
- 30 13. A method for making decisions regarding applications for financial services, comprising:

- (a) receiving application data from at least one source;
- (b) processing the application data; and
- (c) routing the data to at least one decision engine;
- (d) wherein the step (c) of routing considers at least two alternative decision engines.

- 5 14. The method of claim 9 wherein the step (a) receiving comprises the application of an automated Graphical User Interface (GUI) Generator to display a user screen.
- 15. The method of claim 9 wherein the step (a) receiving comprises the application of an automated Graphical User Interface (GUI) Generator to receive data from a user.
- 16. The method of claim 9 wherein the step (b) processing comprises a batch operation.
- 10 17. The method of claim 9 wherein the step (b) processing comprises a real time operation.
- 18. The method of claim 9 wherein the step (b) processing comprises a load leveling scheme.
- 19. The method of claim 9 wherein the step (c) routing comprises the selection of a
15 single decision engine.
- 20. The method of claim 9 wherein the step (c) routing comprises the selection of at least two decision engines to be used in parallel.
- 21. The method of claim 9 wherein the step (c) routing comprises the selection of at least two decision engines to be used in series.
- 20 22. A method for generating a graphical user interface, comprising:
 - (a) receiving domain data;
 - (b) converting the domain data to a presentable format; and
 - (c) displaying a user screen according to the domain data received in step (a) and the resulting format from the conversion in step (b);
 - 25 (d) wherein each user screen substantially reflects the layout of a printed application for financial services.
- 23. The method of claim 22, wherein the step (a) of receiving comprises inputting data manually.
- 24. The method of claim 22, wherein the step (a) of receiving comprises collecting data
30 from a scanner in a semi-automated process.

25. The method of claim 22, wherein the step (a) of receiving comprises interfacing to a pre-existing database of domain data.
26. The method of claim 22, wherein the step (a) of receiving comprises automated conversion from a flat file to data in Extensible Markup Language (XML) format.
- 5 27. The method of claim 22, wherein the step (b) of converting comprises a step (e) of translating from Extensible Markup Language (XML) to Hyper Text Markup Language (HTML) format.
28. The method of claim 27, wherein the step (e) of translating is accomplished with application of Extensible Stylesheet Language (XSL).
- 10 29. The method of claim 22, wherein the step (b) of converting is accomplished with application of Extensible Stylesheet Language (XSL) without resulting in Hyper Text Markup Language (HTML) format.
30. The method of claim 22, wherein the step (b) of converting comprises application of Document Style Semantics and Specification Language (DSSSL).
- 15 31. The method of claim 22, wherein the step (b) of converting comprises application of Cascading Style Sheets (CSS).
32. The method of claim 22, wherein the step (b) of converting is executed on an as-needed basis in response to user action.
33. The method of claim 22, wherein the step (b) of converting is executed when
20 triggered by a change in domain data.
34. The method of claim 22, wherein the step (b) of converting is executed at scheduled intervals.

FIG. 4

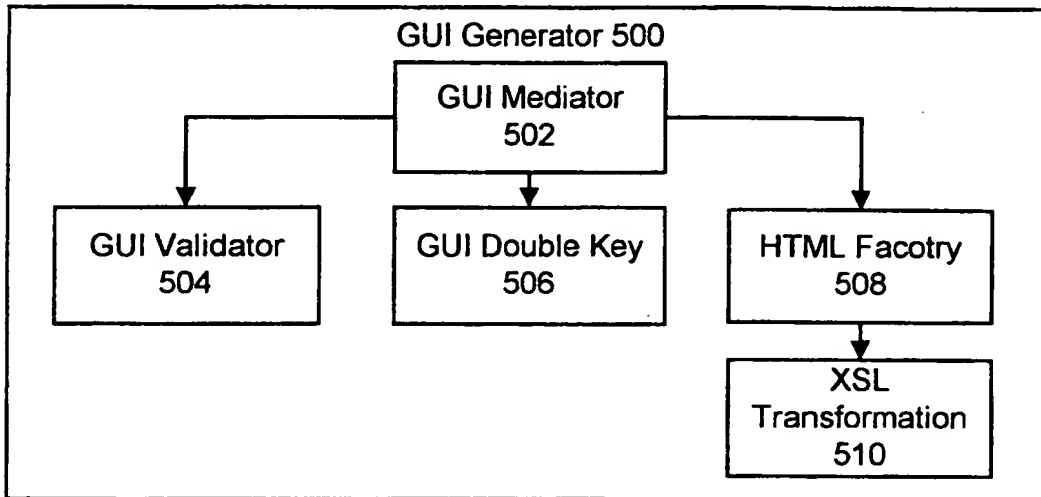

FIG. 5

FIG. 6 is a screenshot of the 'HTML User Screen 600'. At the top is a 'Tool Bar 602' containing three buttons: 'Edit', 'Send', and 'Help'. Below the toolbar are two main data entry sections. The left section, 'Applicant Data 604', contains fields for Name, Address, Employment History 1, Employment Hisotry 2, Employment History 3, Monthly Income, Monthly Obligation 1, Monthly Obligation 2, and Monthly Obligation 3. The right section, 'Product/Service Data 606', contains fields for Product/Service Type, Term 1, Term 2, Term 3, Term 4, and Term 5.

FIG. 6

INTERNATIONAL SEARCH REPORT

International application No.
PCT/US01/04559

A. CLASSIFICATION OF SUBJECT MATTER

IPC(7) : G06F 17/60

US CL : 705/38

According to International Patent Classification (IPC) or to both national classification and IPC

B. FIELDS SEARCHED

Minimum documentation searched (classification system followed by classification symbols)

U.S. : 705/38

Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched

Electronic data base consulted during the international search (name of data base and, where practicable, search terms used)

EAST

search terms: graphic user interface, gui, business, financial, application, domain

C. DOCUMENTS CONSIDERED TO BE RELEVANT

Category*	Citation of document, with indication, where appropriate, of the relevant passages	Relevant to claim No.
X	US 5,805,798 A (KEARNS et al) 08 September 1998, see entire document.	1-21
X	US 5,966,126 A (SZABO) 12 October 1999, see entire document.	22-34

Further documents are listed in the continuation of Box C.

See patent family annex.

* Special categories of cited documents:	*T* later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention
A document defining the general state of the art which is not considered to be of particular relevance	*X* document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone
B earlier document published on or after the international filing date	*Y* document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art
L document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)	*Z* document member of the same patent family
O document referring to an oral disclosure, use, exhibition or other means	
P document published prior to the international filing date but later than the priority date claimed	

Date of the actual completion of the international search

12 APRIL 2001

Date of mailing of the international search report

04 MAY 2001

Name and mailing address of the ISA/US
Commissioner of Patents and Trademarks
Box PCT
Washington, D.C. 20231

BEST AVAILABLE IMAGES

Defective images within this document are accurate representations of the original documents submitted by the applicant.

Defects in the images include but are not limited to the items checked:

- ☐ BLACK BORDERS
- ☐ IMAGE CUT OFF AT TOP, BOTTOM OR SIDES
- ☐ FADED TEXT OR DRAWING
- ☐ BLURRED OR ILLEGIBLE TEXT OR DRAWING
- ☐ SKEWED/SLANTED IMAGES
- ☐ COLOR OR BLACK AND WHITE PHOTOGRAPHS
- ☐ GRAY SCALE DOCUMENTS
- ☐ LINES OR MARKS ON ORIGINAL DOCUMENT
- ☒ REFERENCE(S) OR EXHIBIT(S) SUBMITTED ARE POOR QUALITY
- ☐ OTHER: _____

IMAGES ARE BEST AVAILABLE COPY.

As rescanning these documents will not correct the image problems checked, please do not report these problems to the IFW Image Problem Mailbox.
